

Mobile User VPN

The Mobile User VPN (MUVPN) client configuration is set to read-only so you will not be able to change any of the settings.

When connected to the MUVPN you will be able to connect to all resources within the office network as well as accessing the internet.

You will not, however, be able to connect to any network resources on the local LAN to which you are connected (if at all).

Connection

To establish a MUVPN connection, first ensure that you can browse the internet.

To connect, right click the MUVPN icon and select **Activate Security Policy** from the context menu.

A balloon will confirm the **SafeNet Virtual Adapter** is connected and the MUVPN icon will now show a yellow key indicating a secure connection has been established.

These two icons represent a secure connection with and without network activity respectively.

Disconnection – *Always Disconnect When Finished*

If you need to access local network resources or simply disconnect from the MUVPN, right click the MUVPN icon and select **Deactivate Security Policy** from the context menu. The icon will now show a red bar across it.

Troubleshooting

From time to time, when connected to the MUVPN, network traffic may appear to stop even though the symbol is green. Right click the icon and select **Disconnect All** from the context menu. The **SafeNet Virtual Adapter** should then automatically reconnect as before.
